PATENT

REMARKS

Claims 1-54 are pending in this application and presented for examination.

Applicants hereby elect Group II, drawn to a method for identifying an intact charge-switch NP probe and to an intact charge-switch NP probe, with traverse. Claims readable thereon include claims 18-44. The claims as pending are attached for the Examiner's convenience.

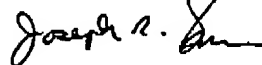

Reconsideration of the restriction requirement is respectfully requested.

Applicants traverse the restriction requirement as the two criteria for a proper restriction requirement have not been met. Under M.P.E.P. § 803, to be proper, the inventions must be independent or distinct; and there must be a serious burden on the Examiner.

Applicants believe Groups I and II should be joined and claims 1-44 examined on their merits. Both independent claims 1 and 18 set forth a sample comprising an intact charge-switch NP probe, an enzyme and an energy field such as an electric field. As such, the requirements for a proper restriction between these two groups has not been met. Accordingly, Groups I and II should be joined and examined together.

If the Examiner believes a telephone conference would expedite prosecution of this application, please telephone the undersigned at 925-472-5000.

Respectfully submitted,

Joseph R. Snyder

PATENT

### PENDING CLAIMS

1                   1.       A method for separating an intact NP probe from a phosphate detectable  
2 moiety, said method comprising:

3                   a)       providing a sample comprising an intact NP probe with a detectable  
4 moiety attached thereto, whereupon an enzymatic cleavage of said intact NP probe, which  
5 produces a phosphate detectable moiety, said phosphate detectable moiety carries a molecular  
6 charge which is different than the molecular charge of said intact NP probe; and

7                   b)       applying an energy field to said sample, thereby separating said phosphate  
8 detectable moiety from said intact NP probe.

1                   2.       The method according to claim 1, wherein said intact NP probe is a  
2 charge-switch nucleotide phosphate probe having a detectable moiety on a terminal phosphate.

1                   3.       The method according to claim 2, wherein said charge-switch nucleotide  
2 phosphate is a nucleotide triphosphate (NTP) having a  $\gamma$ -phosphate with a detectable moiety  
3 attached thereto.

1                   4.       The method according to claim 3, wherein said  $\gamma$ -phosphate with a  
2 detectable moiety attached thereto is a  $\gamma$ -phosphate with a fluorophore attached thereto.

1                   5.       The method according to claim 1, wherein said intact NP probe is  
2 incorporated on a primer strand hybridized to a target nucleic acid using a polymerase, thereby  
3 releasing said phosphate detectable moiety.

1                   6.       The method according to claim 1, wherein said polymerase is  
2 immobilized.

1                   7.       The method according to claim 1, wherein said energy field is an electric  
2 field.

1                   8.     The method according to claim 7, wherein said electric field is a first  
2 electric field applied in a transverse direction and a second energy field is applied in an axial  
3 direction.

1                   9.     The method according to claim 8, wherein said second energy field  
2 applied in said axial direction is a pressure field.

1                   10.    The method according to claim 1, wherein the charge of said phosphate  
2 detectable moiety is greater than said intact NP probe.

1                   11.    The method according to claim 1, wherein the charge of said phosphate  
2 detectable moiety is less than said intact NP probe.

1                   12.    The method according to claim 1, wherein the charge of said phosphate  
2 detectable moiety is opposite in sign compared to said intact NP probe.

1                   13.    The method according to claim 1, further comprising c) detecting said  
2 phosphate detectable moiety.

1                   14.    The method according to claim 13, wherein said detection is via a charge  
2 coupled device (CCD) camera.

1                   15.    The method according to claim 13, wherein said detection is via a dye-  
2 impregnated polymeric coating on optical fiber sensor.

1                   16.    The method according to claim 13, wherein said detection is via a  
2 photodiode.

1                   17.    The method according to claim 13, wherein said detection is via a  
2 blockade current.

1                   18.    A method for identifying an intact charge-switch nucleotide phosphate  
2 (NP) probe, said method comprising:

~~CONFIDENTIAL~~

PATENT

3 a) contacting a sample comprising said intact charge-switch NP probe with  
4 an enzyme to produce a phosphate detectable moiety; and

5 b) applying an electric field to said sample, wherein said phosphate  
6 detectable moiety migrates to an electrode differently than said intact charge-switch NP probe.

1 19. The method according to claim 18, wherein said electrode is an anode.

1 20. The method according to claim 18, wherein said electrode is a cathode.

1 21. The method according to claim 18, wherein either said intact NP probe has  
2 a positive molecular charge, or wherein upon cleavage of said phosphate detectable moiety, said  
3 phosphate detectable moiety carries a positive charge relative to said intact NP probe.

1 22. The method according to claim 18, wherein said enzyme is selected from  
2 the group consisting of a DNA polymerase, a DNA dependent RNA polymerase, a reverse  
3 transcriptase, a phosphodiesterase and a phosphatase.

1 23. The method according to claim 18, wherein said intact charge-switch NP  
2 probe is a member selected from the group consisting of a nucleotide diphosphate, a  
3 deoxynucleotide triphosphate (dNTP), and a nucleotide triphosphate (NTP).

1 24. The method according to claim 23, wherein said deoxynucleotide  
2 triphosphate (dNTP) is a member selected from the group consisting of deoxyadenosine  
3 triphosphate, deoxycytosine triphosphate, deoxyguanosine triphosphate deoxythymidine  
4 triphosphate and deoxyuridine triphosphate.

1 25. The method according to claim 18, wherein said phosphate detectable  
2 moiety is a pyrophosphate with a fluorophore moiety attached thereto.

1 26. The method according to claim 25, wherein upon cleavage of said  
2 pyrophosphate fluorophore moiety, said pyrophosphate fluorophore moiety carries a positive  
3 charge relative to said intact NTP probe.

1                   27.    The method according to claim 18, wherein said intact NP probe has a  
2   positive charge.

1                   28.    The method according to claim 18, wherein said intact NP probe has a  
2   negative charge.

1                   29.    An intact charge-switch nucleotide phosphate (NP) probe, wherein, upon  
2   enzymatic cleavage of said intact charge-switch NP probe to produce a phosphate detectable  
3   moiety, said phosphate detectable moiety migrates to an electrode, and intact charge-switch NP  
4   probe migrates to the other electrode.

1                   30.    The intact charge-switch NP probe according to claim 29, wherein either  
2   said intact NP probe has a positive molecular charge, or wherein upon cleavage of said  
3   phosphate detectable moiety, said phosphate detectable moiety carries a molecular positive  
4   charge relative to said intact NP probe.

1                   31.    The intact charge-switch NP probe according to claim 29, wherein said  
2   charge-switch NP probe is a nucleotide triphosphate (NTP); and wherein said phosphate  
3   detectable moiety is a pyrophosphate with a fluorophore moiety attached thereto.

1                   32.    The intact charge-switch NP probe according to claim 29, wherein said  
2   intact NTP probe has a positive charge.

1                   33.    The intact charge-switch NP probe according to claim 31, wherein upon  
2   cleavage of said phosphate detectable moiety as a pyrophosphate fluorophore moiety, said  
3   pyrophosphate fluorophore moiety carries a positive charge relative to said intact NTP probe.

1                   34.    The intact charge-switch NP probe according to claim 29, wherein said  
2   NTP probe is a member selected from the group consisting of a deoxynucleotide triphosphate  
3   (dNTP), and a nucleotide triphosphate (NTP).

1                   35.    The intact charge-switch NP probe according to claim 34, wherein said  
2   NTP probe is a deoxynucleotide triphosphate (dNTP).

1                   36.    The intact charge-switch NP probe according to claim 35, wherein said  
2    deoxynucleotide triphosphate (dNTP) is a member selected from the group consisting of  
3    deoxyadenosine triphosphate, deoxycytosine triphosphate, deoxyguanosine triphosphate  
4    deoxythymidine triphosphate and deoxyuridine triphosphate.

1                   37.    The intact charge-switch NP probe according to claim 34, wherein said  
2    nucleotide triphosphate (NTP) is a member selected from the group consisting of adenosine  
3    triphosphate, cytosine triphosphate, guanosine triphosphate and uridine triphosphate.

1                   38.    The intact charge-switch NP probe according to claim 31, wherein said  
2    fluorophore moiety is attached to said terminal phosphate via a linker.

1                   39.    The intact charge-switch NP probe according to claim 38, wherein said  
2    fluorophore linker is an alkylene group having between about 5 to about 12 carbons.

1                   40.    The intact charge-switch NP probe according to claim 38, wherein said  
2    linker carries at least one positive charge.

1                   41.    The intact charge-switch NP probe according to claim 38 wherein said  
2    linker carries at least two positive charges.

1                   42.    The intact charge-switch NP probe according to claim 29, wherein at least  
2    one of the phosphate moieties of said nucleotide phosphate probe has an ionized oxygen atom  
3    with a counter-cation associated therewith.

1                   43.    The intact charge-switch NP probe according to claim 29, wherein said  
2    counter-cation is a metal ion.

1                   44.    The intact charge-switch NP probe according to claim 43, wherein said  
2    metal ion is selected from the group consisting of  $Mg^{++}$ ,  $Mn^{++}$ ,  $K^{+}$  and  $Na^{+}$ .

1                   45.    A method for sequencing a nucleic acid, said method comprising:  
2                   providing a target nucleic acid, a primer strand, a polymerase, and a plurality of  
3    NP probes;

PATENT

4 mixing said target nucleic acid, said sequencing primer, said polymerase, said  
5 plurality of NP probes in a flowcell under conditions permitting target dependent polymerization  
6 of said plurality of NP probes, thereby providing a polymerization product; and  
7 separating the polymerization products by an energy field in said flowcell to  
8 provide a sequence of said target nucleic acid.

1 46. The method according to claim 45, wherein the polymerization of said  
2 plurality NP probes produces a plurality of phosphate detectable moieties.

1 47. The method according to claim 45, wherein said plurality of NP probes are  
2 incorporate'd on said primer strand hybridized to said target nucleic acid using said polymerase,  
3 thereby releasing a  $\gamma$ -phosphate with a detectable moiety attached thereto.

1 48. The method according to claim 45, wherein said energy field is an electric  
2 field.

1 49. The method according to claim 48, wherein said electric field is a first  
2 electric field applied in the transverse direction and a second electric field applied in the axial  
3 direction.

1 50. A method for sequencing a nucleic acid, said method comprising:  
2 providing a target nucleic acid, a polymerase priming moiety, a polymerase, and a  
3 plurality of intact NP probes;  
4 mixing said target nucleic acid, said polymerase priming moiety, said polymerase  
5 and said plurality of NP probes under conditions permitting target dependent polymerization of  
6 said plurality of NP probes, such conditions which are capable of providing a time sequence of a  
7 plurality of phosphate detectable moieties;  
8 separating by charge said plurality of phosphate detectable moieties from said  
9 plurality of intact NP probes; and  
10 detecting over time said plurality of phosphate detectable moieties to provide a  
11 sequence of said target nucleic acid.

1                    51.     The method according to claim 50, wherein said primer moiety is a hairpin  
2     loop.

1                    52.     The method according to claim 50, wherein said plurality of phosphate  
2     detectable moieties independently selected from the group consisting of PPI-Dye, a terminal  
3     phosphate fluorophore moiety, a detectable moiety, charged groups, electrically active groups,  
4     reporter groups, and combinations thereof.

1                    53.     The method according to claim 52, wherein said phosphate fluorophore  
2     moiety is a used for a member selected from the group consisting of one-color sequencing, two-  
3     color sequencing, three-color sequencing, four-color sequencing and combinations thereof.

1                    54.     The method according to claim 50, wherein said polymerase is  
2     immobilized in single molecule configuration.
